Title : Coordinated Conference of the Institutes of the Academy of Medical Sciences USSR, the Institutes of the Academies of Sciences of the Union Republics on Problems of Oncology.

Orig Pub : V. Opr. onkologii, 1955, No 5, 121-126.

Abst : The conference was held in Moscow in June 1955. More than 100 specialists from scientific-research institutes of different cities of the USSR participated in the conference. A report by A.I. Serebrov characterized the present state of investigations of the basic problems of oncology (the origin of tumors, search for dependable methods of early diagnosis of malignant tumors, development of effective methods of their treatment, search for means

of prophylaxis of malignant tumors) and the immediate tasks which confront the oncologists. Accounts of talks by representatives of different institutes, laboratories, and clinics engaged in research on malignant tumors are given. The problems of chemotherapy of cancer, and the pathology and etiology of malignant tumors were discussed in detail. The necessity of development in the USSR of scientific statistics on the morbidity of and mortality from cancer was indicated. Considerable attention was paid to the work of the section of kray pathology of malignant tumors; ways of study were pointed out and tasks and duties were assigned to scientific institutes of the USSR.

3492. (933) A NEW METHOD OF SURGERY IN TUBERCULOUS COXITIS AND CERTAIN PELVIC TUMOURS (Russian text) - Chaklin V. D. - KHIRURGIIYA 1958, 7 (3-9) illus. 8

For 5 yr. radical treatment of tuberculous coxitis and of certain pelvic tumours (chondromata) with localizations predominantly near the fundus of the acetabulum has been carried out by intrapelvic approach. The method consists in working towards the internal surface of the acetabulum by an internal subperiosteal route, with medial shifting of the iliac muscle. When in this way the acetabulum has been reached, it is simple to break its wall and to open up the coxo-femoral joint. Through the opening made partial resection of the head of the femur can easily be carried out. Ten patients have been treated by this method with good results. In children and young persons the acetabulum has been observed to regenerate completely.

1807. Operative treatment of scoliosis (Russian text) *Prof.* CHAKLIN V. D. Ortop. Traum. i Protez. 1958, 19/4 (3-11) Illus. 6

The indications of osteosynthesis of the vertebral column in the treatment of scoliosis are listed. The best age for the operation is between 12 and 15 yr. The operation must be preceded by straightening of the vertebral column by means of longitudinal weight traction on the pelvis and transverse traction on the convexity of the scoliotic curve of the thorax. A description is given of a personal technique of extensive fixation of the vertebral column with long bone grafts, preferably from the thoracic hump, with extrapleural thoracoplasty. The clinical results have been followed up 2-18 yr. after the operation in 200 patients. The patients' growth had been normal. In 95.8% of the cases with second-degree scoliosis the results have been excellent; in 4.2% they have been unsatisfactory. In third-degree scoliosis excellent or good results have been obtained in 75.7% of the cases, satisfactory results in 16.3%, and unsatisfactory results in 8% of the cases.

AUTHOR: Chakrabarti, B.

ORG: Department of Theoretical Physics (Kafedra teoreticheskoy fiziki)

TITLE: Interrelation between longitudinal, surface, and transverse waves on the boundary of a plasma

SOURCE: Moscow. Universitet. Vestnik. Seriya III. Fizika, astronomiya, no. 5, 1966, 30-38

TOPIC TAGS: plasma wave propagation, longitudinal wave, surface wave, plasma interaction, electron plasma, surface tension, transverse wave

ABSTRACT: The problem is solved in several variants, depending on whether the longitudinal and surface waves in a plasma are taken into consideration and whether surface tension on the boundary is allowed for. The plasma is assumed to fill the half space $z > 0$, and an electromagnetic wave is incident on the boundary at an angle to the x axis, which is directed along the line of intersection of the planes of incidence of the wave and the plasma boundary. Linearized plasma equations in the hydrodynamic approximation are used to describe the plasma and the boundary conditions. It is further assumed that an electron plasma is under the influence of the surface tension, but the nature of this surface tension is not specified. It is shown that the incident transverse wave excites in a plasma a surface wave, a compression wave, and a transverse wave. General expressions are obtained for the amplitudes, intensities,

Card 1/2

UDC: 533.951

ACC NR: AP6036163

and phases of all four types of waves, including the reflected wave in vacuum. Six types of solutions of the problem are considered (TT, TTS, TTS_σ, TTL, TTL_σ, and TT(LS)_σ, where T - transverse, L - longitudinal, S - surface, σ - surface tension). It is shown that the problem can be fully solved only for the TT, TTS, and TTL cases, and also for the wave reflected in the vacuum. The intensities, refraction angles, and the phases of the waves are estimated under conditions of a gas plasma, and the relative intensities of the different waves are in turn estimated from them. The author thanks Professor A. A. Vlasov for suggesting the topic and for valuable hints. Orig. art. has: 12 formulas and 1 table.
